

HTML Function Audit ? Main Code Extract

Is document me templates ke andar jo functional JavaScript logic add hai, uska ****main code extract**** diya gaya hai.

Scope Checked

- 'templates/dashboard.html'
- 'templates/Department.html'
- 'templates/Employee_Dashboard.html'
- 'templates/Create_Employee.html'
- Inline handlers in other templates ('onclick="history.back()"', confirm dialogs, etc.)

1) 'dashboard.html' ? Sidebar tab switching

****Location:**** 'templates/dashboard.html:329-354'

```
'''html
<script>
    function showTab(element, tabId) {
        // 1. Sidebar Links Reset
        document.querySelectorAll('.sidebar-link').forEach(link => {
            link.classList.remove('active');
            link.classList.add('text-slate-400');
        });

        // 2. Active Sidebar Styling
        element.classList.add('active');
        element.classList.remove('text-slate-400');

        // 3. Tab Switching Logic
        document.querySelectorAll('.tab-content').forEach(tab => {
            tab.classList.remove('active');
        });
        const targetTab = document.getElementById(tabId);
        if (targetTab) {
            targetTab.classList.add('active');
        }

        // 4. Update Header Title
        const tabName = element.innerText.trim();
        document.getElementById('tab-title').innerText = tabName;
    }
</script>
'''
```

2) 'Department.html' ? Department form toggle

****Location:**** 'templates/Department.html:139-149'

```
'''html
<script>
    function toggleForm() {
        const form = document.getElementById('addDeptForm');
        if (form.classList.contains('hidden')) {
            form.classList.remove('hidden');
            form.scrollIntoView({ behavior: 'smooth' });
        } else {
```

```

        form.classList.add('hidden');
    }
}
</script>
'''

---

## 3) 'Employee_Dashboard.html' ? Employee tab switching

**Location:** 'templates/Employee_Dashboard.html:196-203'

'''html
<script>
    function switchTab(tabId, element) {
        document.querySelectorAll('button').forEach(btn => btn.classList.remove('active-link'));
        element.classList.add('active-link');
        document.querySelectorAll('.tab-content').forEach(tab =>
tab.classList.remove('active'));
        document.getElementById(tabId).classList.add('active');
    }
</script>
'''

---

## 4) 'Create_Employee.html' ? Form progress state logic

**Location:** 'templates/Create_Employee.html:206-216'

'''html
<script>
    const form = document.getElementById('employeeForm');
    const progressBar = document.getElementById('progressBar');

    form.addEventListener('focusin', (e) => {
        const name = e.target.name;
        if (['first_name', 'last_name', 'email'].includes(name)) progressBar.style.width =
'35%';
        else if (['department', 'job', 'hire_date'].includes(name)) progressBar.style.width =
'70%';
        else if (['salary', 'phone'].includes(name)) progressBar.style.width = '90%';
    });
</script>
'''

---

## 5) Other inline functional handlers (quick list)

#### Navigation / tab actions
- 'templates/dashboard.html': multiple 'onclick="showTab(this, '...')"' bindings for sidebar
tabs.
- 'templates/Employee_Dashboard.html': buttons use 'onclick="switchTab('...', this)"'.
- 'templates/Department.html': button uses 'onclick="toggleForm()"'.

#### Browser back handlers
- 'templates/Job.html': 'onclick="history.back()"'
- 'templates/Employee_Update.html': 'onclick="history.back()"'
- 'templates/Create_Employee.html': 'onclick="window.history.back()"'

#### Confirm handlers
- 'templates/dashboard.html': delete action with 'onclick="return confirm('Are you sure?')"'
- 'templates/Department_Detail.html': delete link with confirmation.

```

Final Note

Aapke HTML me core custom functions mainly ye 3 declared functions hain:

1. 'showTab(...)'
2. 'toggleForm(...)'
3. 'switchTab(...)'

Aur 'Create_Employee.html' me ek functional event-listener based logic hai ('focusin' progress update), jisko upar main code ke roop me include kiya gaya hai.
